

What is claimed is:

sub
Pl
5 1. A film-winding device for camera for winding a photographic film around a take-up spool in a take-up chamber comprising:

a spring attachment hollow formed in a wall of said take-up chamber;

10 a film-press spring being positioned in said take-up chamber, said film-press spring having a main body for guiding a leading end of said photographic film at a commencement of said film winding, and a plate bent in U-shape against said main body;

a pressing arm being projected from said main body for pressing said photographic film around said take-up spool;

15 a fitting arm being protruded from said plate so as to be transformable elastically, said fitting arm pressing a wall surface of said spring attachment hollow when said plate inserts into said spring attachment hollow; and

20 a slip prevention claw formed in said plate, said prevention claw engaged to said wall surface of said spring attachment hollow so as not to slip said plate from said spring attachment hollow.

25 2. A film-winding device for camera as claimed in claim 1 wherein

said plate bent in U-shape is a bit smaller than said spring attachment hollow in width;

said fitting arm being widened outside in order that an

external width having said fitting arm and said main body being larger than a width of said spring attachment hollow.

5 3. A film-winding device for camera as claimed in claim 2 wherein said main body, said pressing arm, said plate, said fitting arm, and said slip prevention claw are integrally formed.

10 4. A film-winding device for camera as claimed in claim 3 wherein said slip prevention claw is widened in a separating direction from said main body, said slip prevention claw being engaged to a side wall surface of said spring attachment hollow
15 with said fitting arm.

20 5. A film-winding device for camera as claimed in claim 3 wherein said slip prevention claw is widened in a direction parallel with said plate, said slip prevention claw being engaged to an edge wall surface of said spring attachment hollow.

25 6. A film-winding device for camera, for winding a photographic film around a take-up spool in a take-up chamber comprising:

a film-press spring disposed in said take-up chamber, said

film-press spring having a tip section for pressing said photographic film towards said take-up spool, and an end section for fixing said film-press spring to a wall of said take-up chamber;

5 a spring attachment hollow positioned in said wall of said take-up chamber; and

a support section formed in said end section of said film-press spring so as to be elastically transformable, said support section having a slip prevention claw, said slip
10 prevention claw being engaged to said wall surface of said spring attachment hollow for preventing said film-press spring from slipping out from said spring attachment hollow.

15 7. A film-winding device for camera, for winding a photographic film around a take-up spool in a take-up chamber comprising:

a film-press spring disposed in said take-up chamber, said film-press spring having a tip section for pressing said
20 photographic film towards said take-up spool, and an end section for fixing said film-press spring to a wall of said take-up chamber;

a spring attachment hollow positioned in said wall of said take-up chamber; and

25 a support section formed in said end section of said film-press spring so as to be elastically transformable, said support section having a fitting arm and a slip prevention claw, said fitting arm pressing a wall surface of said spring

attachment hollow for supporting said film-press spring, said
slip prevention claw being engaged to said wall surface of said
spring attachment hollow for preventing said film-press spring
from slipping out from said spring attachment hollow.
